

Web Hero Setup - Chand

Web Hero — Setup Instructions for Chand

Anha and Nazifa are on Mac, so a few setup steps are different for you on Windows. Once setup is done, you'll be typing the exact same commands as them — nothing extra to learn after this.

This guide uses a tool called **MSYS2**, which gives Windows a proper C compiler and the `make` tool, the same way Mac gets these from Xcode and Homebrew.

Follow this top to bottom, in order. It looks long, but each step is short, and you only need to do this once.

Step 1 — Install MSYS2

1. Go to **<https://www.msys2.org>**
2. Download the installer and run it (keep all default options)
3. When it finishes, it opens a blue terminal window automatically. That's the **MSYS2 terminal** — different from regular Command Prompt or PowerShell.

In that blue window, run:

```
pacman -Syu
```

If it asks you to close and reopen the window partway through, do that, then run `pacman -Syu` one more time.

Step 2 — Install the compiler, make, and git

```
pacman -S mingw-w64-ucrt-x86_64-gcc mingw-w64-ucrt-x86_64-make git
```

Press Y (or Enter) if asked to confirm. This installs:

- **gcc** — the C compiler (turns your code into a runnable program)
- **make** — runs our build instructions automatically
- **git** — for downloading and syncing the project

Step 3 — Install raylib

```
pacman -S mingw-w64-ucrt-x86_64-raylib
```

Step 4 — Switch terminal type going forward

Close the blue MSYS2 window. From now on, open the Start menu and search for **“MSYS2 UCRT64”** specifically — that's the version matching the compiler you just installed. Use this one for the rest of the project.

Step 5 — Download the project

In the MSYS2 UCRT64 terminal:

```
cd /c/Users/YourUsername/Desktop
git clone https://github.com/Anha-Khan/Weboftrails.git
cd Weboftrails
```

Replace `YourUsername` with your actual Windows username.

Step 6 — Switch to your own branch

```
git checkout feature/chand
```

This is your personal workspace. You can experiment here freely without affecting Anha's or Nazifa's work.

Step 7 — Open the project in VS Code

From inside the `weboftrails` folder, in the same terminal:

```
code .
```

This opens the whole project folder in VS Code. If `code` isn't recognized, open VS Code normally and use **File then Open Folder** instead.

Inside VS Code, open a terminal panel via **Terminal then New Terminal**. If it opens regular PowerShell instead of MSYS2, click the small dropdown arrow next to the **+** in the terminal panel and select **"MSYS2 UCRT64"** from the list. If it's not listed, just keep using the separate MSYS2 UCRT64 window from Step 4.

Step 8 — Build and run the game

In the MSYS2 UCRT64 terminal, inside the `weboftrails` folder:

```
make run
```

A window should open with a sky-blue background, a green ground, and a colored box you can move with **A/D** and make jump with **SPACE**.

If you get an error, copy the exact text (Visual Studio Code shows it in the terminal output) and send it to Anha or paste it into Claude. Don't guess at fixes — setup errors are normal on a first try.

Step 9 — Read the team workflow guide

Before changing or adding anything, open `CONTRIBUTING.md` in the project folder. It explains how the team uses git so nobody overwrites anyone else's work, plus common mistakes to avoid. Every command in it works exactly the same in your MSYS2 terminal as it does in Mac Terminal.

Quick glossary

- **MSYS2** — the tool that gave Windows a C compiler, make, and a way to install raylib (Windows' version of Xcode plus Homebrew on Mac).
- **Repo** — the whole project, as it exists on GitHub.
- **Clone** — downloading a copy of the repo onto your computer.
- **Branch** — your own personal workspace inside the project.
- **Commit** — saving a snapshot of your changes.
- **Push** — uploading your changes to GitHub.
- **Pull** — downloading others' changes onto your computer.

If anything doesn't make sense, ask. There's no such thing as a dumb question — everyone on this team is still learning this.
